

Software QA Tester

Description

To successfully test new, innovative software applications, develop test routine, and to support and enhance existing software applications in visualisation, augmented reality and virtual reality.

Responsibilities

Key Responsibilities:

- Assist in the creation and refinement of internal documentation and testing processes
- Configure and execute automated testing procedures
- Clearly identify and document defects and issues, including clear description, steps to reproduce, any additional information/files needed, and document testing around related areas of the product
- Clearly communicate testing status to the team in an open, balanced and objective manner and on a regular basis
- Participate and coordinate testing efforts with 3rd party clients
- Work with cross-functional team (artists, engineers, software developers) to create comprehensive test strategies and plans based on requirements and specifications.

Team Responsibilities

- Participate with the design and development of product functional areas and proof-of-concepts, based on functional designs and specifications
- Participate in product development, technology adoption and process improvement
- Participate in specification reviews (requirements through detail design) to ensure resulting specifications are complete, testable and address the functional requirements
- Participate in the development/maintenance of project deliverables
- Accept personal responsibility/accountability for own standards of working practice, ensuring that the internal testing procedures are adhered to at all times

Qualifications

- Have experience in the use of issue tracking software (experience with Helpdesk software desirable)
- Experience working in an Agile development team and with Continuous Integration systems.
- Experience of testing applications and experiences across multiple platforms (Mobile, Desktop, VR/AR)
